

Anton's Sand Control Techniques and Services

Sand production is a critical issue for unconsolidated sandstone reservoirs, which unduly restricts the field productivity. Anton is the pioneer in sand control technology and it provides integrated services including sand control solutions, sand control products, and technical services.

Sand Management Designs and Field Services

Anton provides well completion and sand control designs, oilfield block sand control evaluation, sand control product designs, and on-site technical services for clients' reservoirs.

Beijing

Tianjin

Qingdao

Houston

Anton sand control technical team is formed by more than 30 different technical experts and engineers. Their workplaces include three sand control and completion tools research centers in China and the technical center in Houston. By researching on formation sand production mechanism and trend, the technical team is able to perform experiments to simulate formation sand production, fluid flow and pressure change.

In addition, the technical team is capable to provide formation sand sieve analysis, screen selection and strength test, oil water flow behavior experiment, and gravel packing simulation for horizontal wells. The consulting service for sand control techniques and on-site operation service are also available.
